Science Friday
Brooke Woelber

Science Friday serves as an opportunity for 7th grade middle-school students to engage in inquiry-based learning as part of their science curriculum. During this program, the scientific method will be emphasized as students serve as lead scientists who are responsible for the development of their own research experiments.

Students will conduct 3 separate research experiments that occur for a period of 6 weeks each. Research experiments will include models for basic ecological concepts as follows: nutrient cycling (Winogradsky Column), biodiversity (bacterial cultures) and parental care (the burying beetle).

Follow the students’ progress on the Science Friday Blog:
